

Instructions for use: Weather protection of electronics

In order to ensure the proper functioning and long service life of access control systems integrated into handles, doors must be protected from the weather. Exposure to rain, snow, strong sunlight or extreme temperatures can adversely affect the electronics.

It is recommended to install the door in recesses or to use a protective roofing, which will effectively limit the exposure of the handle with the electronics to harmful weather conditions such as precipitation and intense sunlight.

Failure to provide adequate protection can lead to damage to the system, resulting in a loss of warranty.

During external and internal construction work, the handle must be protected from dirt.
